

HIO-2009-0503 ATutor 1.6.2 Cross-site framing

ATutor 1.6.2 contains a cross-site framing vulnerability which can be exploited by malicious people to conduct phishing attacks.

Input passed to the "p" parameter in documentation/index.php is not properly verified before being linked into the frameset, which can be used to conduct spoofing or phishing attacks.

The vulnerability is confirmed in version 1.6.2. Other versions may also be affected.
