

## HIO-2008-0114 Dansie Search Engine XSS

Dansie Search Engine contains a flaw that allows a remote cross site scripting attack. This flaw exists because the application does not validate the "keywords" variable upon submission to the search.pl script. This could allow a user to create a specially crafted URL that would execute arbitrary code in a user's browser within the trust relationship between the browser and the server, leading to a loss of integrity.
