

HIO-2008-0213 Tendenci CMS XSS

Tendenci CMS contains a flaw that allows a remote cross site scripting attack. This flaw exists because the application does not validate "category", "searchtext", "jobcategoryid, and "contactcompany" variables upon submission to the search.asp script. This could allow a user to create a specially crafted URL that would execute arbitrary code in a user's browser within the trust relationship between the browser and the server, leading to a loss of integrity.
